

Algebra--Distributive Property

Big Ideas:

- > Distribute Parenthesis before combining like terms.
- > Combine like terms before beginning to isolate the variable
- > Use the additive inverse when working with integers (include the signs in front of the integers)

Steps:

1. Analyze the problem.
2. Distribute.
3. Collect like terms.
4. Do the inverse in reverse order of operations. (Undo the equation.)
5. Isolate the variable.

Examples:

$$\begin{array}{r}
 \overbrace{5(x-4)}^{\text{red}} = \overbrace{3(x+2)}^{\text{blue}} \\
 5x - 20 = 3x + 6 \\
 \quad +20 \quad \quad +20 \\
 \hline
 5x = 3x + 26 \\
 -3x \quad -3x \\
 \hline
 2x = 26 \\
 \frac{2x}{2} = \frac{26}{2} \\
 \boxed{x = 13}
 \end{array}$$

$$\begin{array}{r}
 \overbrace{2(x-2)}^{\text{red}} - \overbrace{5(2x+1)}^{\text{red}} = 15 \\
 \boxed{2x - 4 - 10x - 5} = 15 \\
 -8x - 9 = 15 \\
 \quad +9 \quad +9 \\
 \hline
 -8x = 24 \\
 \frac{-8x}{-8} = \frac{24}{-8} \\
 \boxed{x = -3}
 \end{array}$$

$$\begin{array}{r}
 -3 \overbrace{(x+3)}^{\text{blue}} = -1 \overbrace{+ 2(x-3)}^{\text{red}} \\
 \boxed{-3 - x - 3} = \boxed{-1 + 2x - 6} \\
 -x - 6 = 2x - 7 \\
 \quad +7 \quad \quad +7 \\
 \hline
 -x + 1 = 2x \\
 +x \quad \quad +x \\
 \hline
 \frac{1}{3} = \frac{3x}{3} \\
 \boxed{\frac{1}{3} = x}
 \end{array}$$
